

David's questionable guide to

# SONIC

It has a pretty cool display

YES

It's like a tuner

It tells you which note you're playing!

Before you begin:

- Open the **BILL OF MATERIAL**
- Collect all the **Needed Parts**
- Download the

## ARDUINO SKETCH

- Print and fold this guide

"say goodbye to yr yellow ink cartridge"

This project should be suitable for beginners. You really don't need any programming skills for the arduino.

It should work first try...

If not, there are a few things you can check.

(keep in mind I'm not a electrician, I'm 1/8th of an A4)

- Diode orientation  
This happens sometimes
- U used a 79L05  
It should be a 78L05
- Bad solder connections  
Reflow all the connections
- Wrong display  
Check my Github for the right display
- Bad arduino  
Maybe try it with a different arduino? An official one?

Start with soldering the **RESISTORS** and C2

Patience  
These come later...

Check the PWR header for shorts

If everything's fine Go ahead and

PLUG IT IN  
PLUG IT IN

(seriously tho, it can blow up your system)

Next up, the powerconverter, diode and capacitor.

Mind the **POLARITY** OF THESE COMPONENTS

White part = negative

Pinheader 4  
Arduino

**Power Header**

<Use unshrouded headers plz.>

Plug yr **ARDUINO** into yr PC computer and upload the sketch

"C'mon, I'd be 15 by now"

Make sure the display, LEDs and jacks are in place B4 soldering them

M3 screw

Now, put the **POWER** on
